

Behind the Project

My Transformation

A modern recovery companion designed for bariatric patients to monitor weight loss, body changes and long-term progress in one structured, easy-to-use application.

Project Overview

My Transformation was created as a concept for a digital recovery journal supporting people after bariatric surgery. The application helps users document their transformation beyond simple weight tracking by combining health metrics, body measurements, progress photos and personal milestones in a single workspace.

Instead of requiring users to switch between spreadsheets, notes, photo galleries and calendar applications, My Transformation centralises the entire recovery journey into one intuitive interface designed for long-term motivation and consistency.

The primary goal of the project is to simplify daily progress tracking while making achievements easier to visualise and celebrate throughout the recovery process.

The Challenge

Recovery after bariatric surgery involves much more than recording body weight. Patients often monitor measurements, compare progress photos, follow personal goals, remember important milestones and document how their body changes over time.

Most existing solutions either focus only on weight statistics or require information to be scattered across multiple applications.

This project was designed to combine:

- weight tracking
- body measurements
- progress photography
- recovery milestones
- visual statistics
- personal journal entries
- calendar events
- long-term goal monitoring

into one consistent user experience.

Design Approach

The project was built around three core principles.

Simplicity

The interface was designed to remain clean, welcoming and easy to navigate, allowing users to focus on their progress rather than learning a complex application.

Motivation Through Visual Progress

Rather than presenting numbers alone, the application emphasises visual transformation through charts, statistics, comparison photos and milestone tracking. The goal is to help users recognise achievements that may otherwise go unnoticed during a long recovery journey.

Privacy First

All personal information is stored locally within the browser. Users maintain full control over sensitive health-related data without creating accounts or relying on external cloud services.

Technologies

- HTML
- CSS
- JavaScript
- IndexedDB
- Claude AI
- ChatGPT

Key Features

- Interactive Recovery Dashboard
- Weight History Tracking
- Body Measurement Management
- Progress Photo Gallery
- BMI & Weight Statistics
- Goal Progress Tracking
- Recovery Timeline
- Personal Notes & Journal
- Calendar & Important Events
- Local-first Architecture

Final Thoughts

This project was created to demonstrate more than front-end development.

It showcases product thinking, user-centred design and workflow optimisation by focusing on a real-life recovery process that extends beyond traditional weight tracking.

The result is an application designed to make long-term progress easier to monitor, more motivating to maintain and significantly more organised through a single, structured workspace.
